

# Technical Fact Sheet

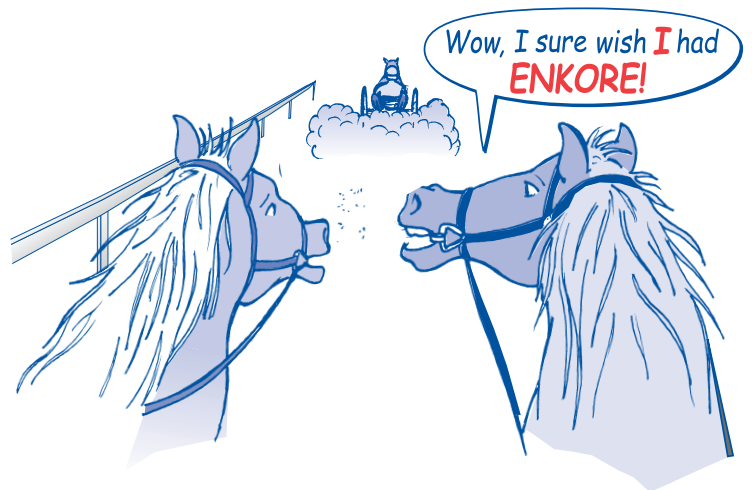

Packaging: 30 ml/tube - 12 tubes per box

Ingredients: Creatine Monohydrate (1050 mg / tube), L-Carnitine (950 mg / tube), Gamma-AminoButyric Acid (5150 mg / tube), Copper Lysine (250 mg / tube).

Directions for Use: Administer two (2) tubes 2-4 hours prior to work, race or any competitive event.

Features: **EnKore** is a pleasant tasting oral paste that helps nerve impulses to communicate faster with one another thus allowing muscles to work more efficiently and effectively which effectively minimizes overall muscle fatigue thus aiding muscle endurance, which helps both owners and horses get to the winner's circle more often. **Creatine** has been used for many years by high performance athletes to help enhance the abilities of the muscle group to perform work with greater intensity, by replenishing the ATP lost during the anaerobic phase of exercise. The more creatine in the muscle cells translates directly to enhanced performance. **Gamma-aminobutyric acid**, first discovered in Berlin in 1893, is an amino acid classified as a neurotransmitter (a natural substance that transmits nerve impulses across a synapse.) Its function is to signal the pituitary gland to release growth hormone (GH). Among the attributes of GH is its ability to act as a powerful analgesic through its stimulation of the brains' release of endorphins. Furthermore, GH is also known for its anabolic and lipotropic effects. Thus GABA's growth hormone elevating effects may rival some of the well-known pharmaceutical components.
